15 akers rd, Lawnton

SKILLS

Frontend: Angular, TypeScript, SCSS, HTML, Angular Material

Backend: Node.js, Express.js, REST APIs, JWT Authentication

Database: MongoDB /Atlas, Mongoose

DevOps & Testing: Docker, CI/CD, Jest, Playwright, npm Others: JSON-LD structured data, meta tags, responsive design

EDUCATION

FEB 2023 - MAY 2025

TORRENS UNIVERSITY OF AUSTRALIA

Bachelors of Information Technology

LANGUAGES

English
Malayalam

PROFILE

Junior software engineer with hands-on experience building full- stack web applications using Angular and Node.js. Completed an internship at Brisbane Capital where I contributed to real production features — including reusable components, SEO integrations, testing pipelines, and CI/CD workflows. Particularly drawn to backend logic and problem-solving, and currently building an end-to-end expense tracking system to deepen my full-stack capabilities. Comfortable working both independently and collaboratively, and eager to grow within a team where I can keep learning on the job.

WORK EXPERIENCE

May 2025 - August 2025

Brisbane Capital

Software Engineer Intern

- Built reusable Angular standalone components (loan calculator, FAQ accordion, article loader), improving UI consistency and cutting duplication across pages.
- Integrated SEO optimisations — JSON-LD structured data, meta tags and breadcrumb schema — improving search visibility and indexing.
- Wrote Jest unit tests and Playwright end-to-end tests, reducing regressions and increasing confidence in releases.
- Contributed to Docker-based CI/CD pipelines for more consistent, repeatable deployments, working through Git and GitHub pull requests and code review.

PERSONAL PROJECTS

Expense Tracker Web App - Angular Application

<https://github.com/Simon-Mathew/expense-tracker-2.0.git>

- Zoneless Angular finance app (signals + SSR) with an RxJS budget aggregator over a full-CRUD Express/MongoDB API.
- Engineered a budget tracking feature using RxJS forkJoin to fire parallel HTTP requests, aggregate per-category spending against user-defined limits, and render animated progress cards
- Implemented Angular SSR with provideClientHydration(withEventReplay()) and structured reusable components using content projection (ng-content named slots) and CSS design tokens

GeoStamp Application - Angular Application

- Built for Brothers Trading Company so field staff can log each site visit — location captured automatically and the photo data Claude extracts saved straight into MongoDB.
- One-click Excel export of logged sites via SheetJS, with Cloudinary image storage and deployment to Render.
- Image geolocation tool with dual EXIF + Claude-vision extraction behind a shared interface, with selectable auto / EXIF / vision / compare modes.

Personal Fitness and Calorie Tracking Application React + Vite Applic

<https://github.com/Simon-Mathew/fitness-app-calories.git>

- Zoneless Angular finance app (signals + SSR) with an RxJS budget aggregator over a full-CRUD Express/MongoDB API.
- Built a full-stack fitness tracking app with React 19 and Node.js/Express — real-time dashboard, nutrition logger, and workout tracker with full CRUD persistence; no UI component library used
- Architected a custom data layer using four domain hooks (useWorkouts, useGoals, useActivity, useFoodLog) with optimistic updates, race-condition prevention, and per-section independent loading states
